Advanced Database Management System Lab Subject Code: MCAL13

A Practical Journal Submitted in Fulfilment of the Degree of

MASTER

In

COMPUTER APPLICATION

Year 2023-2024

By

Mr. Vishwakarma Dheeraj Kumar Jaynath (Application Id: - 78383)

Semester- 1

Under the Guidance of

Prof.

Institute of Distance and Open Learning
Vidya Nagari, Kalina, Santacruz East – 400098.
University of Mumbai

PCP Centre

[Vidyavardhini's College of Technology – Vasai Road, Palghar 401202]

Institute of Distance and Open Learning,

Vidya Nagari, Kalina, Santacruz (E) -400098

CERTIFICATE

This to certify that, Mr. Vishwakarma Dheeraj Kumar Jaynath appearing Master in Computer Application (Semester I) Application ID: 78383 has satisfactory completed the prescribed practical of MCAL13-Advanced Database Management System Lab as laid down by the University of Mumbai for the academic year 2023-24

Teacher in charge

Examiners

Coordinator IDOL, MCA University of Mumbai

Date: -31/01/2024

Place: - Vasai

Index

Sr. No.	Practical	Signature
1.	Implementation of Data partitioning through Range	
2.	Implementation of Analytical queries like Roll_UP, CUBE, First, Last, Rank AND Dense Rank	
3.	Implementation of Abstract Data Type & Reference	
4.	To study ETL process	
5.	Installation of R datatype in R programming Reading and Writing data to and from R	
6.	To study Linear Regression.	
7.	To study Analysis of Regression	
8.	To study Logistic Regression	
9.	To study support Vector Machine	
10	To study varied Algorithm	

RANGE Partitioning in MySQL

Aim: Implementation of Data partitioning through Range

ANALYTICAL QUERIES

Aim: Implementation of Analytical queries like Roll_UP, CUBE, First, Last, Rank AND Dense Rank.

```
SQL> CREATE TABLE emp(
2 empno NUMBER(4) CONSTRAINT pk_emp PRIMARY KEY,
3 ename VARCHAR2(10),
4 job VARCHAR2(10),
5 mgr NUMBER(4),
6 hiredate DATE,
7 sal NUMBER(7,2),
8 comm NUMBER(7,2),
9 deptno NUMBER(2));

Table created.

SQL> INSERT INTO emp VALUES(1, 'Hema', 'Developer',2,'22-May-2020',25000,2000,4)
2 ;
1 row created.

SQL> INSERT INTO emp VALUES(2,'Ram','Developer',2,'20-April-2019',45000,2300,4);
1 row created.

SQL> INSERT INTO emp VALUES(3,'Vrudhi','Tester',4,'20-April-2019',30000,8000,5);
1 row created.
```

SQL> INSERT INTO emp VALUES(4, 'Rahul', 'Tester',4, '5-November-2018',50000,8000,5);

1 row created.

```
SQL> SELECT * FROM emp;
    EMPNO ENAME
                     JOB
                                     MGR HIREDATE
                                                          SAL
                                                                    COMM

Aim: Implementation of Abstract Data Type & Reference

Customer reltab:

CREATE TABLE Customer_reltab (CustNo NUMBER NOT NULL, CustName VARCHAR2(200) NOT NULL, Street VARCHAR2(200) NOT NULL, City VARCHAR2(200) NOT NULL, State CHAR(2) NOT NULL, Zip VARCHAR2(20) NOT NULL, Phone1 VARCHAR2(20), Phone2 VARCHAR2(20), Phone3 VARCHAR2(20), PRIMARY KEY (CustNo));

PurchaseOrder reltab:

CREATE TABLE PurchaseOrder_reltab (PONo NUMBER, /* purchase order no */
Custno NUMBER references Customer_reltab, /* Foreign KEY referencing
customer */ OrderDate DATE, /* date of order */ ShipDate DATE, /* date to be shipped */
ToStreet VARCHAR2(200), /* shipto address */ ToCity VARCHAR2(200), ToState CHAR(2),
ToZip VARCHAR2(20), PRIMARY KEY(PONo));

```
SQL> CREATE TABLE PurchaseOrder reltab (
 2 PONo NUMBER, /* purchase order no */
 3 Custno NUMBER references Customer_reltab, /* Foreign KEY
    referencing
    customer */
   OrderDate DATE, /* date of order */
ShipDate DATE, /* date to be shipped */
    ToStreet VARCHAR2(200), /* shipto address */
 8
 9
     ToCity VARCHAR2(200),
     ToState CHAR(2)
10
     ToZip VARCHAR2(20),
11
12 PRIMARY KEY(PONo));
Table created.
SQL>
```

Stock_reltab:

CREATE TABLE Stock_reltab (StockNo NUMBER PRIMARY KEY, Price NUMBER, TaxRate NUMBER);

```
SQL> CREATE TABLE Stock_reltab (
2 StockNo NUMBER PRIMARY KEY,
3 Price NUMBER,
4 TaxRate NUMBER);
Table created.
SQL>
```

LineItems_reltab:

CREATE TABLE LineItems_reltab (LineItemNo NUMBER, PONo NUMBER REFERENCES PurchaseOrder_reltab, StockNo NUMBER REFERENCES Stock_reltab, Quantity NUMBER, Discount NUMBER, PRIMARY KEY (PONo, LineItemNo));

```
SQL> CREATE TABLE LineItems_reltab (
2 LineItemNo NUMBER,
3 PONO NUMBER REFERENCES PurchaseOrder_reltab,
4 StockNo NUMBER REFERENCES Stock_reltab,
5 Quantity NUMBER,
6 Discount NUMBER,
7 PRIMARY KEY (PONo, LineItemNo));

Table created.

SQL>
```

Inserting Values Under the Relational Model:

```
INSERT INTO Stock_reltab VALUES(1004, 6750.00, 2);
INSERT INTO Stock_reltab VALUES(1011, 4500.23, 2);
INSERT INTO Stock_reltab VALUES(1534, 2234.00, 2);
INSERT INTO Stock_reltab VALUES(1535, 3456.23, 2);
INSERT INTO Customer_reltab VALUES
(1, 'Jean Nance', '2 Avocet Drive', 'Redwood Shores', 'CA', '95054', '415-555-1212', NULL, NULL);
INSERT INTO Customer_reltab VALUES (2, 'John Nike', '323 College Drive', 'Edison', 'NJ', '08820', '609-555-1212', '201-555-1212', NULL);
INSERT INTO PurchaseOrder_reltab VALUES (1001, 1, SYSDATE, '10-MAY-1997', NULL, NULL, NULL, NULL);
INSERT INTO PurchaseOrder_reltab VALUES (2001, 2, SYSDATE, '20-MAY-1997', '55 Madison Ave', 'Madison', 'WI', '53715');
```

Querying Data Under the Relational Model:

SELECT C.CustNo, C.CustName, C.Street, C.City, C.State, C.Zip, C.phone1, C.phone2, C.phone3, P.PONo, P.OrderDate, L.StockNo, L.LineItemNo, L.Quantity, L.Discount FROM Customer_reltab C, PurchaseOrder_reltab P, LineItems_reltab L Advanced Database Management System Lab WHERE C.CustNo = P.CustNo AND P.PONo = L.PONo AND P.PONo = 1001;

Get the Total Value of Purchase Orders

SELECT P.PONo, SUM(S.Price * L.Quantity) FROM PurchaseOrder_reltab P, LineItems_reltab L, Stock reltab S WHERE P.PONo= L.PONo AND L.StockNo = S.StockNo GROUP BYP.PONo;

Get the Purchase Order and Line Item Data for Stock Item 1004

SELECT P.PONO, P.CustNo, L.StockNo, L.LineltemNo, L.Quantity, L.Discount FROM PurchaseOrder_reltab P, Lineltems_reltab L WHERE P.PONo = L.PONo AND L.StockNo = 1004;

Updating Data Under the Relational Model:

UPDATE LineItems reltab SET Quantity = 20 WHERE PONo = 1001 AND StockNo = 1534;

Deleting Data Under the Relational Model:

DELETE FROM LineItems_reltab WHERE PONo = 1001; DELETE FROM PurchaseOrder_reltab WHERE PONo = 1001;

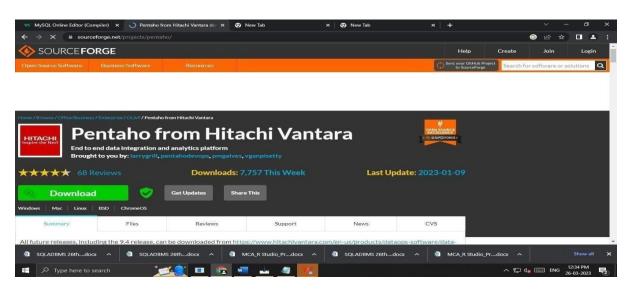

Aim: To study ETL process

* Installation steps for Pentaho Data Integration Software

Step 1: Download Pentaho Data Integration Software. The first thing we need is the Pentaho

Data Integration software that we'll be working with

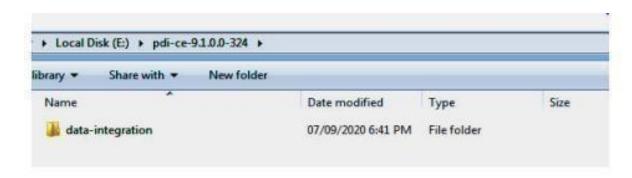

You can download the set up file from link https://sourceforge.net/projects/pentaho/.

Press the "Download" button.

It will start downloading zip file on your computer. Once the downloading is finished, extract the files into a folder you want to.

Your folder should look something like this:

Step 2: Install the Java Dependencies, if Required.

To run Pentaho Data Integration, Java Runtime Environment and Java Development Kit are required. To check if you already have these installed, go to this path in your file explorer:

C:\Program Files\Java Or: C:\Program Files (x86)\Java If this folder exists and you see folders that look like:

Then you have the required files. If this folder doesn't exist or you don't see one or both of these folders, then you need to download JRE and/or JDK. To download JRE, go to this link https://java.com/en/download/ and press "Download."

Your page should look like this:

The installation window will look something like this:

Follow the instructions until finished.

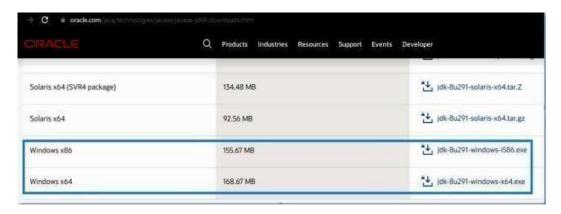

Next, download the JDK from this link

https://www.oracle.com/java/technologies/javase/javase-jdk8- downloads.html.

Please note that there have been substantial changes to the Oracle JDK licensing agreement. Details are available at Oracle Technology Network License Agreement for Oracle Java SE.

There will be a list of different operating systems to choose from. Scroll until you find Windows.

If you're unsure about which version (x64 or x86) your Windows is, select x86.

It will open following window

Press "Download".

If you're not logged in to Oracle, then you will be prompted to log in.

If you don't have an Oracle account, you need to create one in order to download the JDK.

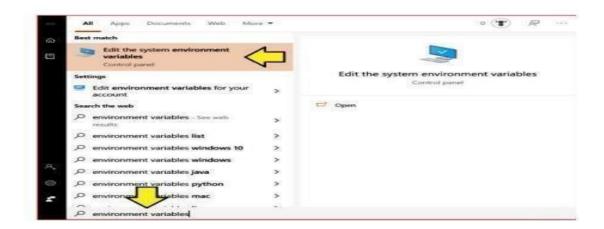

The installation setup will look like this:

Graphics:

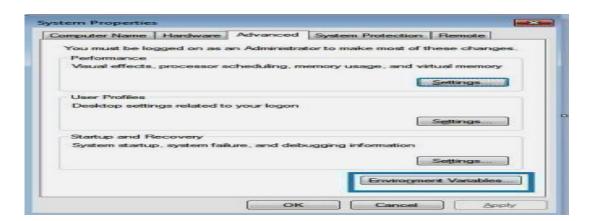

Hitachi Video Management Platform (VMP) has been designed from the ground up to meet the challenges of data storage and processing that new video systems present.

Step 3: Set Up the Environment Variables There are three environment variables that need to be set up. To open the environment variables menu type in "environment variables" in the Windows search bar like this:

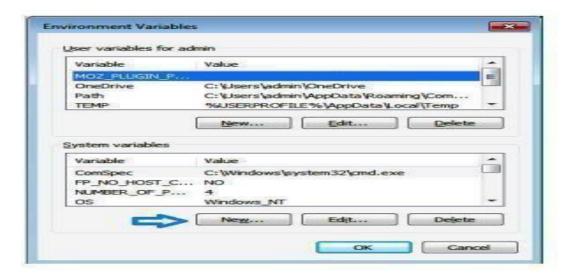

Click the "Edit the system environment variables" option.

That will open the "System Properties" window. Under Advanced tab ...Click the "Environment Variables." button at the bottom.

That will open a window that looks like this:

We need to add three new System variables.

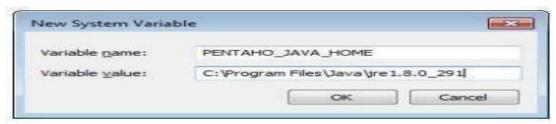

Click the "New..." button under "System variables" and enter the following:

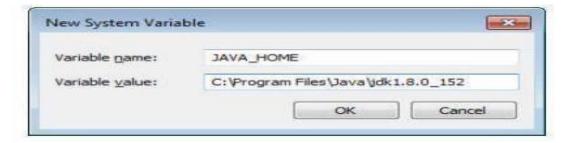

Make sure your variable value file path is the same one on your computer.

Press "OK" and then enter two more.

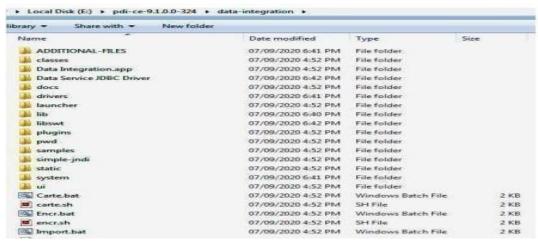

Press "OK".

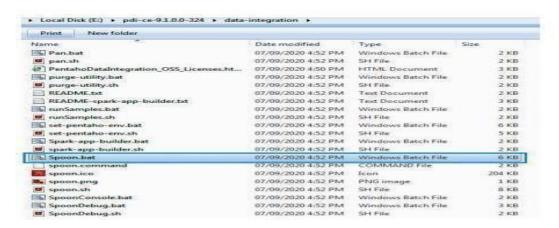

Press "OK" and close all the previous windows by pressing "OK."

Step 4: Open the Pentaho Data Integration App Now that Java is installed successfully and the environment variables are also set, we can start running the Pentaho Data Integrationapp.

The data integration folder that you downloaded earlier will looklike this:

The file that runs the app is called "Spoon.bat".

Double click this file to open the Pentaho Data Integration app.

Now you can start using this app by pressing "New transformation" or "New job."

Aim:

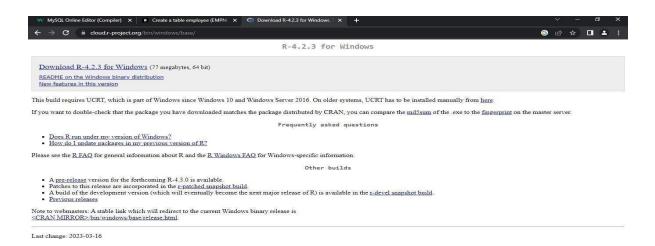

- 1. installation of R
- 2. datatype in R programming
- 3. Reading and Writing data to and from R.

Aim: installation of R

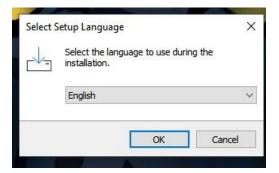

* R Installation in Windows

Steps used to install the R in Windows are as follows:

Step 1: First, we have to download the R setup from https://cloud.rproject.org/bin/windows/base/.

Step 2: When we click on Download R- 4.1.0 for windows, our downloading will start. Once the downloading is finished, we have to run the setup of R as follows:

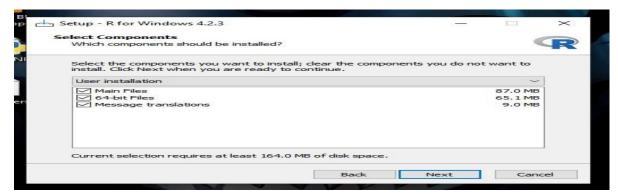

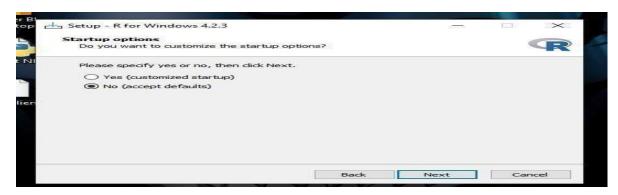

1) Select the path where we want to download the R and click Next

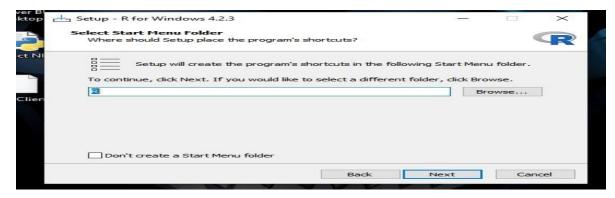

2) Select all components which we want to install, and then click Next.

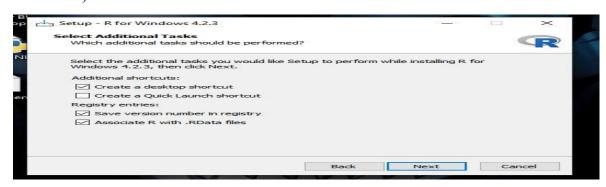

3) Now, we have to select either (customized startup) or (accept the default), and then click Next.

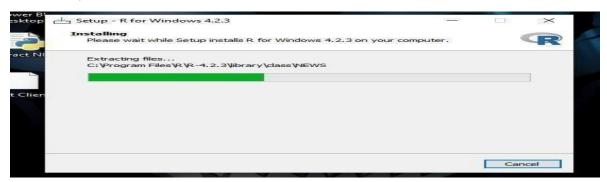

4) Now Select Start Menu Folder window will appear, click Next

5) Click Next

6) When we proceed to Next, installation of R will get started:

7) Finally, we will click on Finish.

R has been successfully installed.

Aim: Datatype in R programming

1. R program to illustrate Numeric data # Assign a decimal value to variable x

```
x = 5.6
```

print the class name of variable x print(class(x))

print the type of variable x print(typeof(x))

```
R 4.1.3 · ~/ 
>
> # Assign a decimal value to variable x
> x = 5.6
> # print the class name of variable x
> print(class(x))
[1] "numeric"
> # print the type of variable x
> print(typeof(x))
[1] "double"
>
```

Output:

- [1] "numeric"
- [1] "double"

2. R program to illustrate Numeric datatype

```
# Assign an integer value to variable y
y = 5
# print the class name of variable y print(class(y))
# print the type of variable y print(typeof(y))
```

```
R 4.1.3 · ~/ 
> # Assign an integer value to variable y
> y = 5
> # print the class name of variable y
> print(class(y))
[1] "numeric"
> # print the type of variable y
> print(typeof(y))
[1] "double"
>
```

Output:

- [1] "numeric"
- [1] "double"

3. R program to illustrate Numeric datatype

Assign an integer value to variable y y = 5 # is variable y an integer? print(is.integer(x))

```
R 4.1.3 · ~/ 
> # Assign an integer value to variable y
> y = 5
> # is variable y an integer?
> print(is.integer(x))
[1] FALSE
>
```

Output:

- [1] FALSE
 - 3. R program to illustrate integer data type # Create an integer variable x = as.integer(5)

```
# print the class name of variable x print(class(x))
# print the type of variable x print(typeof(x))
```

Declare an integer by appending 'L' as suffix. y = 5L

print the class name of y
print(class(y)) # print the type of y print(typeof(y))

```
R 4.1.3 · ~/ 
> # Create an integer variable
> x = as.integer(5)
> # print the class name of variable x
> print(class(x))
[1] "integer"
> # print the type of variable x
> print(typeof(x))
[1] "integer"
> # Declare an integer by appending 'L' as suffix.
> y = 5L
> # print the class name of y
> print(class(y))
[1] "integer"
> # print the type of y
> print(typeof(y))
[1] "integer"
> # print the type of y
> print(typeof(y))
[1] "integer"
>
```

Output:

- [1] "integer"
- [1] "integer"
- [1] "integer"
- [1] "integer"

5. R program to illustrate logical data type # Two variables x = 4

y = 3

Comparing two values z = x > y # print the logical value print(z)

print the class name of z print(class(z))

print the type of z

print(typeof(z))

```
R 4.1.3 · ~/ **

> # Two variables

> x = 4

> y = 3

# Comparing two values

> z = x > y

# print the logical value

> print(z)
[I] TRUE

> # print the class name of z

> print(class(z))
[I] "logical"

> # print the type of z

> print(typeof(z))
[I] "logical"

>
```

Output:

- [1] TRUE
- [1] "logical"
- [1] "logical"

6. R program to illustrate complex datatype # Assign a complex value to variable x x = 4 + 3i # print the class name of variable x print(class(x)) # print the type of variable x print(typeof(x))

```
R R4.1.3 · ~/ 
> # Assign a complex value to variable x
> x = 4 + 3i
> # print the class name of variable x
> print(class(x))
[1] "complex"
> # print the type of variable x
> print(typeof(x))
[1] "complex"
>
```

Output:

- [1] "complex"
- [1] "complex"

7. R program to illustrate character data type

```
# Assign a character value to char char = "Mumbai University"
# print the class name of char
print(class(char))
# print the type of char
print(typeof(char))
```

Output:

- [1] "character"
- [1] "character"

Aim: Reading and Writing data to and from R.

Reading data files with read.table()

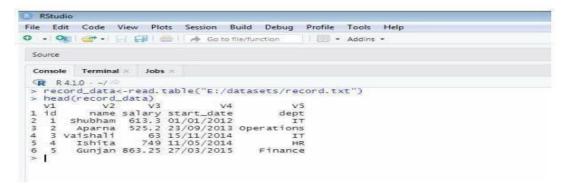

The read.table() function is one of the most common used functions for reading data into R. It has following arguments.

The function read.table() can be used to read the data frame.

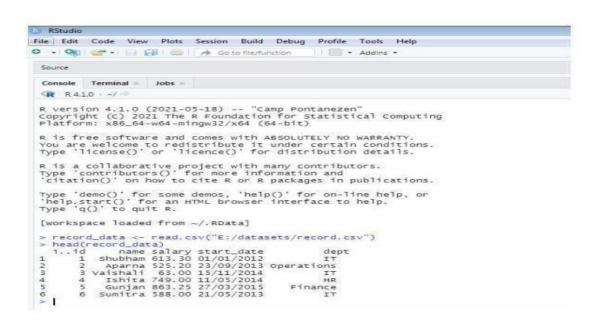

We have kept record.txt and record.csv files under datasets folder inside E: drive.

>record_data<- read.table("E:/datasets/record.txt")
>head(record_data)
#returns first n rows of the data

Similarly, read.csv() function can be used to read data from csv files. >record_data<- read.csv("E:/datasets/record.csv") >head(record data) #returns first n rows of thedata

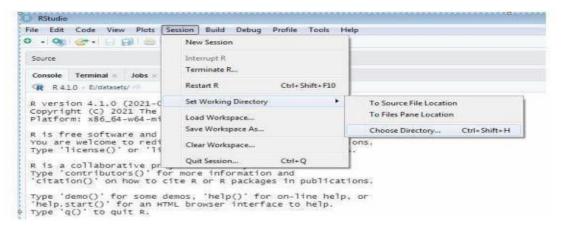

*Writing Data to a File

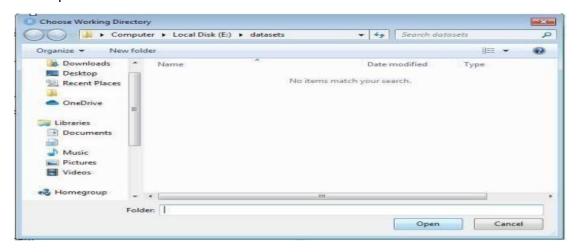

After working with a dataset, we might like to save it for future use. Before we do this, let's first set up a working directory so we know where we can find all our data sets and files later.

Setting up a Directory

From RStudio, use the menu to change your working directory under Session > Set Working Directory > Choose Directory

Click Open.

Alternatively, you can use the setwd() function to assign working directory.

> setwd("E:/datasets")

To check your current working directory, type

> getwd()

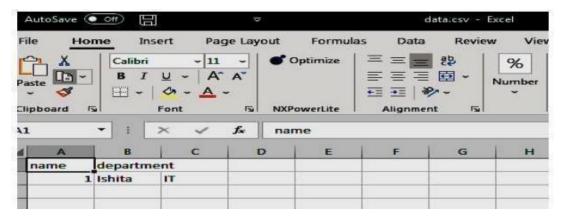

In R, we can write data easily to a file, using the write.table() command.

x<-data.frame(name ="Ishita", department = "IT") write.table(x, file ="data.csv", sep = ",")

By going to this location E:/datasets,you should see a data.csv file.

y<-data.frame(name ="Ankit", department = "HR") write.table(y,"E:/datasets/mydata.txt", sep = "\t")

```
> y<-data.frame(name ="Ankit", department = "HR")
> write.table(y, "E:/datasets/mydata.txt", sep = "\t")
> |
```

Now, let's check whether R created the file mydata.txt under E:/datasets folder or not.

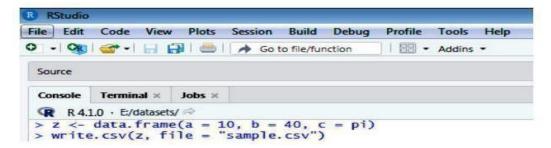

Print E-mail New folder			
Name	Date modified	Туре	Size
data.csv	11/07/2021 12:12	Microsoft Excel C	1 KB
mydata.txt	11/07/2021 12:17	Text Document	1 KB
record.csv	09/07/2021 10:37	Microsoft Excel C	1 KB
record.txt	09/07/2021 10:38	Text Document	1 KB

By going to this location E:/datasets, you should see a mydata.txt file.

```
mydata.txt - Notepad
File Edit Format View Help

"name" "department"
"1" "Ankit" "HR"
```

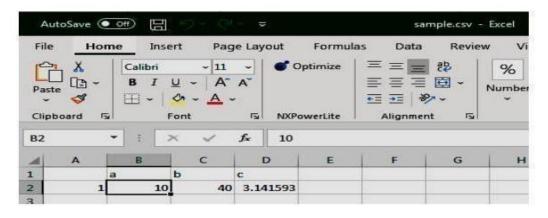

z <- data.frame(a = 10, b = 40, c = pi) write.csv(z, file = "sample.csv")

Now, let's check whether R created the file sample.csv under E:/datasets folder or not.

By going to this location E:/datasets,you should see a sample.csv file.

Aim: To study Linear Regression program:

```
import numpy as np
class LinearRegression:
def __init___ (self):
self.b0 = 0
self.b1 = 0
def fit (self, X, y):
X mean = np.mean (X)
y mean = np.mean (y)
numerator, denomintor = 0, 0
for in range (len (X)):
numerator += (X[]-X mean)*(y[]-y mean)
denomintor += (X[ ]-X mean)**2
self.b1 = numerator / denomintor
self.b0 = y mean - (X mean*self.b1)
return self.b0, self.b1
def predict (self, X):
y_hat = self.b0 + (self.b1 * X)
return y_hat
if name == ' main ':
X = np.array ([173, 160, 154, 188, 168], ndmin=2)
X = X.reshape (5, 1)
y = np.array ([73, 65, 54, 80, 70])
model = LinearRegression ()
b0, b1 = model.fit(X, y)
print (b0, b1)
